

# Tennis Life Simulator

## Game Design Brief — v0.1

### 1. Product Vision

**Tennis Life Simulator** is a 繁體中文, short-form, highly replayable tennis career and life simulation game.

The player does not control individual tennis points or matches. Instead, they control the **life decisions surrounding a randomly generated tennis player** and watch that player's career unfold through training, tournaments, injuries, relationships, money, opportunities, temptations, luck, and historical events.

The central fantasy is:

**“What kind of tennis player could I have become if I had lived a different life?”**

Every playthrough represents one complete life.

A player might:

- become World No. 1 and win multiple Grand Slams
- become a talented but inconsistent ATP player
- barely reach the Challenger Tour
- become a university tennis star
- quit tennis at 23 and build a completely different life
- become a coach after retirement and eventually produce a World No. 1
- or simply live a happy, ordinary life

The game should never imply that only becoming World No. 1 is a successful outcome.

---

## 2. Player Experience

The intended emotional arc is:

**“Wait... this kid might actually have something.”**

→

**“Holy shit, I might actually make it.”**

→

**“I’m playing against Federer/Nadal/Djokovic-level players.”**

→

**“I was THIS close to becoming World No. 1.”**

→

**“What if I had made a different decision?”**

The ideal reaction after a run is:

**“I need to play one more life.”**

The game should create stories that feel partially authored by the player and partially discovered through fate.

---

### 3. Core Design Philosophy

The game combines:

- Life simulation
- RPG-like character development
- Roguelike replayability
- Narrative events
- Sports simulation
- Historical alternate history

The player should feel approximately **50% in control and 50% subject to fate**.

Player decisions matter.

But luck, talent, injuries, opportunities, timing, opponents, coaches, and circumstances also matter.

The game should avoid becoming a pure optimization spreadsheet.

---

### 4. MVP Setting

**Starting Year**

1992

## Starting Age

6 years old

The character is approximately born in **1986**.

## End Point

The simulation can continue through the player's tennis career and eventual post-tennis life.

The initial historical simulation is centered around the **2004–2026 ATP era**, when the character reaches professional-level tennis.

## Gender

**Male only for MVP.**

A women's version can be added later.

## Discipline

**Singles only for MVP.**

Doubles are excluded from the initial version.

## Nationality

For MVP, the character is **Taiwanese / born in Taiwan**.

Nationality is an important gameplay variable, but randomizing nationality is intentionally postponed until a later version.

This allows the MVP to focus on building the career and historical systems without introducing excessive geopolitical complexity.

---

# 5. Character Generation

The player does **not** create their player's attributes.

At the beginning of every run, the game generates a completely new character.

The player chooses only:

- Character name

Everything else is generated.

Possible generated characteristics include:

- Physical build
- Height / growth potential
- Natural physical ability
- Tennis talent
- Mental tendencies
- Luck
- Family background
- Family financial resources
- Initial athletic aptitude
- Learning characteristics
- Hidden potential

The player should not immediately understand the full potential of the character.

---

## 6. Childhood Backstory

Before the character reaches age 6, the game generates a short narrative backstory based on the generated characteristics.

For example:

A tall, athletic child from a financially comfortable family showed unusual hand-eye coordination from an early age.

Or:

His parents do not have much money, but his physical ability has already attracted attention from a local tennis coach.

Or:

His parents simply wanted him to exercise. Nobody expected him to become unusually good at tennis.

The backstory establishes the initial conditions of the life.

It should not reveal the exact hidden potential values.

---

## 7. Visible Player Stats

The player can see the main tennis attributes.

## Technical

- Serve
- Forehand
- Backhand
- Volley

## Physical

- Fitness / Stamina
- Strength
- Speed

## Mental / Experience

- Tennis IQ
- Mental Strength
- Pressure Resistance
- Match Experience

The values should be understandable and game-readable.

---

# 8. Emergent Playing Style

**Playing style is not a separate player-created class.**

It emerges naturally from the character's attributes.

For example:

### High Serve

Narrative may describe the player as:

A powerful server who frequently gets free points.

### Strong Forehand + Fitness

The game may describe:

A relentless baseline player who wins through physical consistency.

## High Tennis IQ + Moderate Physical Stats

The game may describe:

A clever tactician who constantly finds ways to disrupt opponents.

## High Serve + Volley

The player may gradually develop an aggressive all-court style.

Playing style should primarily influence **match simulation and narrative descriptions**, rather than creating rigid RPG classes.

---

# 9. Hidden Potential System

The player has a hidden **Talent / Potential** value from 0–100.

The exact number is never revealed.

Talent represents the player's **upper developmental potential**, not guaranteed ability.

A player with 76 talent can still become extremely successful if they have:

- excellent decisions
- strong coaching
- persistence
- good development
- favorable circumstances
- luck

Likewise, a player with high talent can waste their career.

## Rough interpretation

### 80+

Meaningful potential to reach the ATP level and potentially become a top player.

### 50–85

More commonly leads toward university tennis, ITF, or Challenger tennis, but exceptional development and luck can push the player much higher.

### Below 50

Usually suggests a difficult professional career and may eventually encourage the player toward coaching, university tennis, or another profession.

These are tendencies, not hard career locks.

---

## 10. Hidden Potential Dimensions

Instead of one simple talent number internally, the simulation should use several hidden potential dimensions.

These values are never directly shown to the player.

### Technical Potential

Determines the ceiling and growth potential of tennis technique.

### Physical Potential

Determines potential for:

- strength
- speed
- stamina
- physical development

### Ball Feel

Represents natural ability to learn and refine tennis strokes.

### Tennis Understanding Potential

Determines how naturally the player develops:

- tactical understanding
- opponent adaptation
- surface understanding
- match intelligence

### Mental Potential

Determines the potential development of:

- mental strength
- pressure resistance
- confidence

- big-match performance

## **Durability Potential**

Influences:

- injury probability
- recovery
- long-term career durability

## **Learning Ability**

Determines how effectively the player benefits from:

- coaches
- training
- new techniques
- tactical systems
- experience

The game should communicate these characteristics indirectly through events and narrative.

---

# **11. Luck**

Luck is a major independent force.

The game should treat luck as more than a simple  $\pm$  random modifier.

Luck can influence:

- injury timing
- tournament draws
- discovering the right coach
- being noticed by an important person
- sponsorship opportunities
- unexpected invitations
- opponent injuries
- favorable circumstances
- unfortunate circumstances
- important life encounters

A player's career is therefore influenced by three major forces:

**Talent + Effort + Luck**

None of the three alone determines the outcome.

---

## 12. Annual Gameplay Loop

The game progresses primarily year by year.

Each year contains approximately **2–5 major decisions or events**.

A typical year may include:

1. Training / development decision
2. Coach-related decision
3. Tournament / career decision
4. Life event
5. Off-court opportunity or temptation
6. Tournament simulation
7. Injury / recovery
8. Financial update
9. Ranking update
10. End-of-year summary

The exact number of events should vary to keep the experience unpredictable.

---

## 13. Training

Training is a major player decision.

The player can choose different approaches, such as:

- Technical training
- Physical training
- Mental training
- Intensive training
- Recovery
- Following coach recommendations
- Changing training priorities

Training should involve trade-offs.

For example:

Heavy physical training may accelerate development but increase injury risk.

Rest may reduce short-term development but prevent a serious injury.

Technical specialization may improve one weapon while slowing overall development.

Overtraining should **not** guarantee better results.

---

## 14. Coaches

Coaches are important narrative characters.

They are not simply numerical buffs.

The quality of the initial coach is influenced by:

- family resources
- luck
- circumstances

Different coaches have distinct personalities and philosophies.

Examples:

- Strict old-school coach
- Data / analytics-oriented coach
- Encouraging mentor
- Clay-court specialist
- Former Grand Slam player
- Physical-training specialist
- Tactical strategist
- Youth-development specialist

Coaches can influence:

- technical development
- physical development
- mental development
- training efficiency
- tactical understanding
- career decisions

They should also generate meaningful narrative events.

---

## 15. Coach Evaluation

Coaches should not simply say:

“Your talent is 72.”

Instead, they communicate their assessment indirectly.

For example:

“If you were my son, I'd tell your parents to invest in this.”

Or:

“You should seriously consider training overseas.”

Or:

“You're good enough for university tennis. Whether you're good enough for the pros... we'll see.”

Exceptional talent should occasionally trigger much stronger reactions.

Extremely weak potential can also become apparent over time.

The coach should not be factually “wrong.”

Their assessments can be:

- incomplete
- cautious
- vague
- optimistic
- realistic
- strongly confident

But the underlying simulation should remain internally consistent.

---

## 16. Family

Family is especially important during childhood.

For MVP:

- Family support is assumed to exist.
- Family financial resources vary.

Family resources influence access to:

- better coaches
- equipment
- overseas training
- tournaments
- academies
- travel

Family should matter most during the early stages of development.

As the player becomes financially independent, family influence gradually decreases.

---

## 17. Career Ladder

The career progression should follow a recognizable tennis ladder:

**Junior → ITF → Challenger → ATP**

Access to higher-level tournaments is determined primarily by:

- ranking
- qualification
- invitations
- career status
- historical tournament structures

The game should avoid requiring the player to manually understand every ATP eligibility rule.

The system should automatically determine what level of competition is available.

---

## 18. Tournament Simulation

There is **no point-by-point gameplay**.

The player never manually controls:

- serves
- rallies
- shots
- tactics during individual points

Matches are simulated automatically.

Match outcomes should consider:

- technical stats
- physical stats
- Tennis IQ
- mental strength
- pressure resistance
- match experience
- surface
- current confidence
- injuries
- opponent strength
- talent / development
- luck

The player watches the career unfold rather than playing the tennis match itself.

---

## 19. Surface System

The three major surfaces matter:

- Hard
- Clay
- Grass

Surface performance should emerge from:

- technical attributes
- physical attributes
- tennis IQ
- coaching
- experience
- training
- player development

Some players will naturally become:

- clay specialists
- grass specialists
- hard-court specialists
- all-court players

Surface specialization can become part of the player's identity.

---

## 20. Career Ranking

The game uses a simplified but recognizable ATP-style ranking system.

The player receives ranking points through tournament performance.

Each year ends with a clear:

### **Year-End World Ranking**

The ranking should be one of the most important pieces of the annual summary.

Example:

### **2008 — Year-End Ranking: World No. 47**

The player may also receive:

- titles
  - Grand Slam results
  - career earnings
  - win/loss record
  - major wins
  - ranking peak
- 

## 21. Real ATP Players as Parody Characters

The game takes place in an alternate version of real tennis history.

Major historical players should appear as fictional parody counterparts with recognizable but altered names.

Examples:

- Roger Federer → 費卜勒
- Rafael Nadal → 納達倫
- Novak Djokovic → 喬米契

These characters should initially mirror the general strength and historical trajectory of their real-world counterparts.

The actual player database can be supplied separately and should be treated as structured game data rather than hard-coded assumptions.

---

## 22. Historical Timeline

The game starts from a recognizable real-world ATP timeline.

The historical tennis world acts as the **baseline timeline**.

The player's career gradually interferes with that timeline.

For example:

In the original timeline, Federer-parody wins Wimbledon.

But if the player defeats him:

The player wins Wimbledon instead.

This creates an alternate history.

---

## 23. Historical Butterfly Effect — Simplified

The butterfly-effect system should deliberately remain **limited in scope**.

The player can affect:

- Grand Slam champions
- major tournament results
- year-end rankings
- player title counts
- selected historical achievements

### Important limitation

A player's result in one year should **NOT automatically regenerate the entire following year's tournament draws and seedings**.

The following year's:

- tournament fields
- seeds
- draws
- matchups

should generally continue to use the **original historical structure/data**.

This prevents the simulation from becoming an enormous recursive alternate-history engine.

### **Exception: Player Replacement**

If the player's career becomes strong enough to **formally replace a historical player's position** in the competitive field, then the player's participation can affect the following year's relevant tournament structure.

In other words:

**Normal historical results change history's records.**

But:

**Actual player replacement can change future participation.**

This provides a controlled butterfly effect without requiring full-world simulation.

---

## **24. Historical Achievement Tracking**

At the end of a run, the game should explain:

**“What did you change?”**

Examples:

- Took a Wimbledon title away from Federer-parody.
- Prevented Nadal-parody from winning a particular Grand Slam.
- Became the first Taiwanese player to reach a Grand Slam semifinal.
- Changed the year-end World No. 1.
- Changed a historical player's Grand Slam title count.
- Became the first player from Taiwan to win an ATP Masters 1000.

This should be one of the major emotional rewards of the ending.

---

## **25. Player Knowledge vs Character Knowledge**

The **player** may know real-world tennis history.

The **character does not**.

The character should behave as if they are living in that historical period without knowledge of future events.

For example, the player may know:

“This kid is basically the future Djokovic.”

But the character simply sees:

“A very difficult opponent named 喬米契.”

This creates an enjoyable tension between player knowledge and character knowledge.

---

## 26. Confidence and Experience

Match experience is an important progression system.

Deep Grand Slam runs, especially semifinal appearances and victories, can significantly increase:

- Match Experience
- Confidence
- Fame
- Earnings

This can create a positive feedback loop:

Major success  
→ more confidence / experience  
→ better performance  
→ more major success  
→ higher ranking  
→ more major opportunities

But the reverse can also happen:

Repeated major losses  
→ confidence decreases  
→ performance becomes unstable  
→ ranking declines  
→ fewer major opportunities

The game should provide ways to escape negative spirals.

Possible recovery mechanisms:

- New coach
  - Mental training
  - Rest
  - Reduced schedule
  - Training changes
  - Successful smaller tournaments
- 

## 27. Injuries

Injuries are part of the simulation.

They are influenced by:

- physical condition
- durability potential
- training load
- playing schedule
- behavior
- luck

A player may make a risky decision to return early because they want to protect ranking points.

This should create meaningful consequences.

Returning too early can:

- extend recovery
- increase reinjury risk
- reduce performance
- create chronic problems

The player should sometimes face difficult choices between:

**Career momentum vs long-term health**

---

## 28. Money

The two major sources of income are:

1. Tournament prize money
2. Sponsorship

Money can be spent on:

- tournaments
- travel
- coaches
- training
- medical care
- support staff
- lifestyle

Financial decisions should influence future opportunities.

---

## 29. Sponsorship

The sponsorship system should be simple.

Better:

- ranking
- fame
- achievements

generally lead to better sponsorship opportunities.

The player may occasionally:

- accept a sponsor
- renegotiate
- switch sponsors

The outcome depends primarily on current market value.

The brands are fictional parody brands.

Examples:

- NIKA
- HAAD
- BOBALT
- WIISOM
- YONUX

Additional parody brands can be introduced later.

---

## 30. Fame

Fame increases through:

- rankings
- major tournament success
- national team success
- Grand Slam appearances
- major victories
- media exposure

Fame unlocks new event types.

But fame should not simply be a positive stat.

It should create:

- money
  - sponsorship
  - media opportunities
  - distractions
  - social pressure
  - temptations
  - unwanted attention
- 

## 31. Off-Court Temptations

Most temptations should **come to the player as events** rather than being manually searched for.

Examples:

- Party invitations
- Commercial opportunities
- Luxury purchases
- Media appearances
- Celebrity relationships
- Gambling-related opportunities
- Social events
- Expensive lifestyle choices

These should not always be obvious “good vs bad” choices.

For example:

Accepting a commercial may give money and fame but reduce training time.

Going to a party may improve relationships but hurt recovery.

Buying expensive equipment may improve motivation but damage finances.

The player should sometimes genuinely struggle to decide.

---

## 32. Relationships

The major relationship categories are:

- Parents
- Coach
- Sponsor
- Romantic partner

### Parents

Most important during childhood and early development.

### Coach

Important throughout the career.

### Sponsor

Becomes important once the player becomes commercially valuable.

### Romantic Partner

Primarily narrative-oriented.

Romance can affect the story and life outcome but should not become a complicated relationship-management simulation.

---

## 33. National Team

Strong players may periodically receive opportunities to represent Taiwan in:

- Asian Games
- Olympics

- other national competitions

National team success can increase:

- fame
- money
- national recognition

But it can also create:

- federation conflicts
- teammate conflicts
- scheduling problems
- pressure

The national team should feel meaningful without becoming a second full sports-management game.

---

## 34. Player Agency

Every year should provide meaningful choices.

Choices can have:

### **Immediate Effects**

Example:

Train harder → +technical development, +injury risk

### **Delayed Effects**

Example:

Move overseas → no obvious immediate benefit, but opens better coaching opportunities two years later.

### **Hidden Effects**

Some choices should not reveal their complete consequences.

The player should occasionally think:

“Wait... THAT decision from five years ago caused this?”

This is a major source of replayability.

---

## 35. Wasting Talent

The game must allow players to waste extraordinary talent.

A player with enormous potential may:

- party too much
- reject good coaching
- stop training
- prioritize money
- chase fame
- suffer repeated injuries
- simply lose interest in tennis

Early characters may attempt to save the player's career.

Eventually, people may stop trying.

This should become a legitimate alternate life path rather than a simple “game over.”

---

## 36. Career Exit

At any point, the player can choose to leave tennis.

If the player decides to quit — even at age 26 — the interactive run ends immediately.

The game then generates the character's remaining life as a narrative conclusion.

There is no second interactive simulation in MVP.

For example:

At 26, after years of struggling on the Challenger Tour, you decide that tennis is no longer worth the sacrifice.

The game then narrates the rest of the character's life.

---

## 37. Post-Tennis Life

Possible endings include:

- Tennis coach
- University coach
- Commentator
- Tennis academy owner
- Agent
- Sports business
- Brand founder
- Entrepreneur
- Teacher
- Family-oriented ordinary life
- Completely unrelated career

The ending should not classify these as “good” or “bad.”

A player who never reaches ATP can still have an excellent life.

---

## 38. Legacy

A career ending should summarize more than statistics.

It should answer:

### **Tennis Career**

- Highest ranking
- Grand Slam results
- ATP titles
- Masters titles
- Career earnings
- Win/loss record
- Years on tour
- Major victories

### **Life**

- Important coaches
- Family
- Relationships
- Major life decisions
- Major injuries
- Financial situation
- Post-tennis career

## Historical Impact

- Historical players defeated
- Grand Slam titles changed
- Ranking history changed
- Records created
- National firsts

## Final Narrative

A short story describing what this life ultimately became.

---

# 39. Example of a “Successful but Not GOAT” Ending

A player could finish with:

World No. 38  
2 ATP titles  
1 Grand Slam Quarterfinal  
\$4.2M career earnings  
Several years inside the Top 50  
Later became a coach  
Eventually coached a future World No. 1

The game should communicate:

**This was a successful life.**

Not:

“You failed because you weren't World No. 1.”

---

# 40. Example of a Near-Miss Ending

Another player could finish:

Career-high ranking: World No. 2  
1 Grand Slam final  
7 ATP titles  
\$18M career earnings

And the ending could say:

You spent most of your career chasing the same player.

You beat him several times.

You even reached the final.

But you never won the one match that would have made you World No. 1.

You were incredibly close.

This is exactly the kind of emotional outcome the game should generate.

---

## 41. Replayability

Every new run should generate a different combination of:

- Talent
- Potential
- Physical profile
- Coaches
- Events
- Injuries
- Opportunities
- Decisions
- Luck
- Historical outcomes

The player should constantly wonder:

“What if I had made the other choice?”

A new run should feel like a genuinely different life, not merely a different numerical build.

---

## 42. Run Identity

Each run should feel like a unique person.

The game should gradually create an emergent identity.

For example:

**The Almost Champion**

or

**The Taiwanese Baseline Warrior**

or

**The Wasted Prodigy**

or

**The Late Bloomer**

or

**The Challenger Journeyman**

or

**The Accidental Grand Slam Champion**

These labels can be generated dynamically from the career.

---

## 43. Suggested Seed System

The simulation should use a reproducible random seed.

A seed determines the underlying life circumstances and random events.

This allows:

- replaying a life
- sharing interesting runs
- debugging
- comparing different decisions

Ideally:

**Same seed + same decisions = same life**

The system can still introduce controlled randomness where appropriate, but the underlying simulation should be reproducible.

---

## 44. UI / Interaction Philosophy

The game should prioritize **speed and readability**.

It should not feel like a complicated management simulator.

Avoid a long setup wizard.

The player should get into the character's life quickly.

The core interface should emphasize:

- Current age
- Current year
- Ranking
- Key stats
- Money
- Confidence
- Experience
- Current coach
- Major recent events
- Current career stage
- Available decisions

Events should appear as readable narrative cards.

The player should understand:

“What is happening?”

“What are my choices?”

“What might this cost me?”

without needing to study a manual.

---

## 45. Annual Summary

Every year should end with a concise but satisfying report.

Example:

### 2009 Season

**Age:** 23

**Year-End Ranking:** #47

### **Season Highlights**

- ATP 250 Semifinal
- Challenger Champion ×1
- Wimbledon — 2nd Round
- US Open — 3rd Round

### **Biggest Win**

Defeated World No. 12

### **Development**

- Serve +3
- Tennis IQ +2
- Mental Strength +1

### **Career**

- Prize Money: \$420,000
- Sponsorship: \$180,000

### **Story**

Your new coach has completely changed the way you approach matches.

### **Next Season**

Your ranking is now high enough to enter more ATP tournaments directly.

---

## **46. Tournament Reporting**

For major tournaments, especially:

- Grand Slams
- ATP Masters 1000

the game should provide a more detailed result.

If the player wins an ATP Masters 1000 or higher-level tournament, the annual report should show the opponents defeated and their ranking at the time.

Example:

### **Shanghai Masters — Champion**

- R64: Def. World No. 73
- R32: Def. World No. 29
- R16: Def. World No. 11
- QF: Def. World No. 6
- SF: Def. World No. 3
- F: Def. World No. 1

This reinforces the feeling of:

**“Holy shit. I actually beat all these guys.”**

---

## **47. Difficulty**

The game should be:

**Realistic, but slightly easier than real life.**

Reaching ATP should be genuinely difficult.

Winning a Grand Slam should be rare.

Becoming World No. 1 should be extremely difficult.

However, the player should have a realistic chance of achieving extraordinary outcomes through:

- high talent
- good decisions
- persistence
- development
- luck

The game should feel challenging without becoming depressing.

---

## **48. Failure Philosophy**

Failure is not a game-over state.

A bad tennis career can still produce a compelling life.

The game should embrace:

- unexpected success
- slow development
- career stagnation
- missed opportunities
- injury
- burnout
- financial difficulty
- late blooming
- sudden breakthroughs
- alternate careers

The simulation is about **a life**, not simply winning tennis matches.

---

## 49. MVP Scope

### MUST HAVE

- Random character generation
- Age 6 starting point
- 1992 starting year
- Childhood development
- Hidden talent / potential
- Visible tennis stats
- Training decisions
- Coach system
- Family resource system
- Junior → ITF → Challenger → ATP progression
- Tournament simulation
- ATP-style ranking
- Hard / clay / grass
- Injuries
- Confidence
- Match experience
- Prize money
- Sponsorship
- Fame
- Major life events
- Off-court temptations
- National team events
- Grand Slams
- ATP Masters 1000
- Real-world-inspired parody players

- Historical results
  - Simplified historical butterfly effect
  - Career exit
  - Narrative life ending
  - Replayability
- 

## 50. Explicitly NOT in MVP

Do **not** build:

- Real-time tennis gameplay
- Point-by-point control
- Shot-by-shot tactical decisions
- Doubles
- Women's tour
- Full global alternate-history simulation
- Full real-world economic simulation
- Complex relationship meters
- Detailed second-life gameplay
- Player-created attribute builds
- A long onboarding wizard
- Excessive micromanagement
- Full ATP rulebook simulation

The goal is to build a **fast, addictive life simulator**, not a professional tennis management simulator.

---

## 51. Technical Architecture Principle

The simulation should be data-driven.

Keep the following separate from core game logic:

### Historical Data

- Players
- Rankings
- Tournament results
- Tournament structures
- Grand Slam winners
- Masters winners

- Historical player strength

## Game Data

- Stats
- Potential
- Coaches
- Events
- Sponsors
- Injuries
- Narrative templates
- Career stages

## Simulation Engine

Responsible for:

- Character development
- Tournament simulation
- Ranking updates
- Money
- Injuries
- Events
- Relationships
- Historical modifications
- Ending generation

This allows the historical database to be expanded or replaced without rewriting the core game.

---

# 52. Historical Data Strategy

The first implementation should **not attempt to manually recreate the entire ATP database inside the game logic.**

Instead, build a structured data layer capable of accepting historical player and tournament data.

Historical player data can later be supplied separately.

The simulation engine should consume that data.

This is especially important because the parody players should initially mirror the strength and historical trajectory of their real-world counterparts.

---

## 53. Core Simulation Model

At a high level, the career should emerge from:

CHARACTER

The important design principle is that **the game should not tell the player what their destiny is.**

The player discovers it.

---

## 54. Core Emotional Loop

The ideal loop is:

**Decision → Uncertainty → Consequence → Discovery → “What if?”**

The player should constantly encounter situations where they cannot know the complete outcome.

The game should reward curiosity rather than perfect optimization.

---

## 55. Final Product Identity

This game is not:

“A tennis game where you win matches.”

It is:

**“A game where you live an entire tennis player's life.”**

The player is not trying to control every point.

They are trying to answer:

**“What kind of person could I have become?”**

Sometimes the answer is:

World No. 1.

Sometimes:

World No. 38.

Sometimes:

University tennis legend.

Sometimes:

A coach.

Sometimes:

Someone who quit at 26 and built a completely different life.

And sometimes:

**A player who was one decision away from changing tennis history.**

That uncertainty is the core of the game.
